

Are Bleeding Hemorrhoids a Cause for Worry?

Bleeding **hemorrhoids** are a sign that the condition has become worse. If you are aware that you have **piles** and they suddenly start to bleed, you might want to check with your physician because this means that you have ruptured your hemorrhoids. However, blood in your stool can also be a sign of other serious health conditions.

One Way to Check If the Blood in Your Stool is from Bleeding Hemorrhoids is from Its Color

If it is bright red, this could mean that it came from your piles. People have hemorrhoids and they act as padding for the anal sphincter, the muscle accountable for moving the stool along. They are filled with blood vessels and they help aid in bar stool movement. These blood vessels receive oxygenated blood, therefore the bright red blood, as opposed to the dark red color of the deoxygenated blood. If the blood in your stool is dark red, it may mean that the bleeding will be coming from further up the anal canal or from other parts of your body.

What People Refer to as Piles are Actually Inflamed Hemorrhoids

The inflammation causes discomfort during **bowel** movement. However, if there is blood in your stool, this suggests that you may have ruptured your piles. Since fresh blood is pumped to this structure straight from the heart, the flow of blood is much more intense. People may become anemic due the loss of blood.

Is Also Important to Note that There are Two Types- Internal and External

This is mainly classified depending on their location. **Internal hemorrhoids** are located additional up into the rectum and also you won't be able to see these, unless of course they enlarge to the point that they stick out the anus. Often, internal ones cannot be felt because they are affected by visceral nervousness, which do not transmit pain. **External hemorrhoids** tend to be the ones that people usually see and they are a lot more painful. Both of these can be ruptured and cause bleeding but it is observed more often with internal cases. If you are not aware that you have piles, blood in your stool is a sign that you may have **internal piles**.

Generally, Piles can Subside Over Time When the Cause is No Longer Present

Creams can be used to reduce discomfort and reduce inflammation. However, if bleeding occurs, damage has been done to the hemorrhoids. You should check with your physician regarding the severity of the bleeding.

For Mild Cases of Rupture, It can be Treated With Topical Creams and Ointments

These types of creams help heal the rupture and reduce the inflammation. For severe cases, surgery may be the best option. Most procedures remove the piles simply by cutting it off, or cutting off its blood supply so it dries up. Even some people who have problems with mild to average bleeding turn to surgery because it is the fastest way to treat the problem. However, the process is painful and pricey.

- Bleeding hemorrhoids are a cause for worry but you should not panic.
- Consult with your doctor and also have it taken care of right away to avoid further complications.
